

VETERINARY RESEARCH

Veterinary Research involves the study and research of the causes, prevention, diagnosis and appropriate treatment for diseases on animals. It shows in-depth focus on the animal biology and recommends ideal caring methods that ensures animal welfare.

In veterinary research, the researchers study both naturally occurring diseases as well as induced disease models occurring on animals as well as humans. It further shows keen focus on food safety, zoonotic diseases, public health and safety policies and wildlife ecosystem that play a vital role in animal health.

Similar to human medical research, in veterinary research, randomized controlled trials are performed so as to assure treatment effectiveness, but with comparatively lesser trial numbers and lower quality.
